PROFESSIONAL SUMMARY

Analytical full-stack software engineer who takes systems from idea to production and keeps them running. Comfortable across the whole stack, from Vue 3 frontends and Node.js services to SQL data models and CI/CD. I learn what the job demands, picking up manufacturing, SCADA, and ERP systems on the job and earning two promotions, from intern to software engineer. I'm at my best turning messy real-world operations into efficient, reliable software, and I'm usually the person non-technical teams come to when something needs to work.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, SQL, C#, C++, Python, object-oriented programming.
Frontend: Vue 3, Vite, Nuxt, Pinia, HTML, CSS, Bulma, Chart.js, progressive web apps.
Backend & APIs: Node.js, Express, REST APIs, Socket.IO, JWT/OAuth auth, event-driven jobs.
Data & Integration: SQL Server, Sequelize, AVEVA Historian (SCADA), NetSuite, SuiteQL.
DevOps & Practice: Git, GitHub Actions CI/CD, PM2, Caddy, Cloudflare, end-to-end testing.
AI Tools: Claude Code, ChatGPT; AI-assisted debugging, code review, and refactoring.

CORE STRENGTHS

Analytical · Efficient · Strategic Thinker · Teachable · Knowledgeable · Quick Learner · Dependable

EXPERIENCE

SunTado, Burley, ID — Software Engineer (promoted from Intern, then Junior Developer)

JUNE 2025 - AUGUST 2026

- Built a real-time manufacturing execution system (Node.js, Express, SQL Server, AVEVA Historian) that automated 90%+ of the company's ERP transactions (1.4M+ in seven months) with no manual data entry.
- Identified gaps in production consumption tracking, then designed and built an automated inventory backflush system that raised real-time tracking from ~20% to 95% and eliminated lost inventory updates.
- Wrote 80%+ of the frontend for a Vue 3 progressive web app suite used daily by ~95% of staff, replacing RF-SMART and saving ~\$250K/year in licensing.
- Split a monolithic Express API into independently deployed services with GitHub Actions CI/CD, cutting deployment risk.
- Handled night and weekend production calls about every two weeks for 8 months until systems stabilized, and designed the MES to run unattended with automatic recovery and Teams alerting.
- Built an external web portal (Vue 3, Express, JWT auth) with a milk-diversion planner that forecasts silo capacity, preventing 800,000+ pounds of milk from being dumped in its first week.
- Built real-time Socket.IO dashboards and alerts that surface production problems to operators and Teams as they happen.
- Earned the top rating, Exceeds Expectations, in every category of a formal performance review.

EDUCATION

Brigham Young University-Idaho — Bachelor of Science in Software Engineering

SEPTEMBER 2022 - JULY 2025

Idaho State University — Associate of General Arts

SEPTEMBER 2018 - MAY 2020

PROJECTS

brycechesley.com — Personal Portfolio

Nuxt 4 and TypeScript site with GSAP animations and GitHub Actions deploys, plus a private ops console with first-party analytics and rrweb session replay on Cloudflare Pages Functions and D1.
