PROFESSIONAL SUMMARY

Full-stack software engineer who takes systems from idea to production and keeps them running. Comfortable across the whole stack, from Vue 3 frontends and Node.js services to SQL data models and CI/CD, and at my best turning messy real-world operations into reliable software. I work closely with non-technical teams and I'm usually the person they come to when something needs to work.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, SQL, C#, C++, Python; object-oriented programming
Frontend: Vue 3, Vite, Nuxt, Pinia, HTML, CSS, Bulma, Chart.js, progressive web apps
Backend & APIs: Node.js, Express, REST APIs, Socket.IO, JWT/OAuth auth, event-driven jobs
Data & Integration: SQL Server, Sequelize, AVEVA Historian (SCADA), NetSuite, SuiteQL
DevOps & Practice: Git, GitHub Actions CI/CD, PM2, Caddy, Cloudflare, end-to-end testing
AI Tools: Claude Code, ChatGPT; AI-assisted debugging, code review, and refactoring

EXPERIENCE

SunTado, Burley, ID — Software Engineer (promoted from Junior Developer)

JUNE 2025 - AUGUST 2026

- Sole author of a real-time manufacturing execution system (MES) in Node.js/Express: scheduled pollers read live SCADA historian data and per-tank state machines detect batch starts and ends. With my other services, it posted 90%+ of the company's ERP transaction lines (1.4M+ in the first seven months of 2026) with no operator data entry.
- Engineered the MES to run unattended: restart-safe state recovery, idempotent retries, a review queue for unknown products, a dry-run sandbox mode, and Teams alerting.
- Split a monolithic Express API into independently deployed services (gateway, manufacturing, MES, ERP, printing) with GitHub Actions CI/CD, mapping dependencies to cut deployment risk.
- Wrote 80%+ of the frontend for a Vue 3 progressive web app suite used daily by ~95% of staff; its barcode workflows replaced RF-SMART (~\$250K/year in licensing).
- Built real-time Socket.IO features: KPI dashboards on shop-floor TVs, a live line-staging dashboard, and escalating material-low alerts to operators and Teams.
- Built an automated backflush and consumption system that raised contemporaneous production tracking from ~20% to 95%, and eliminated lost inventory updates by serializing concurrent pallet consumption with per-bin, per-work-order locks.
- Built the external web portal: Vue 3 behind a hardened Express gateway (JWT auth, curated DTOs), including a milk-diversion planner that forecasts silo capacity.

Walmart, Boise, ID — Digital Associate

JANUARY 2022 - MAY 2025

- Fulfilled online pickup and delivery orders in a fast-paced, metrics-driven environment.
- Trusted subject-matter expert for department workflows; routinely assigned complex tasks.

EDUCATION

Brigham Young University-Idaho — Bachelor of Science in Software Engineering

SEPTEMBER 2022 - JULY 2025

Idaho State University — Associate of General Arts

SEPTEMBER 2018 - MAY 2020

PROJECTS

brycechesley.com — Personal Portfolio

Nuxt 4 and TypeScript site with GSAP animations and GitHub Actions deploys, plus a private ops console with first-party analytics and rrweb session replay on Cloudflare Pages Functions and D1

Fobech — Manufacturing Software Side Venture (co-owner)

Interactive MES demo with work orders and lot tracking at demo.fobech.com
